

## CLAIMS

1) An actuating device (4) for a cushion body (2) of a headrest (1), particularly for vehicle seats, 5 comprising two connecting rods (3) projecting from the cushion body (2); the actuating device (4) comprising a supporting frame (5) housed inside the cushion body, and actuating means (6) carried by the supporting frame and fitted to the cushion body (2) to adjust the position of 10 the cushion body (2) with respect to the rods (3); said supporting frame (5) comprising a first substantially platelike portion (10) supporting first connecting means (9) for said actuating means (6); said actuating means comprising a second substantially platelike portion (15) 15 movable with respect to said first platelike portion (10) and supporting at least part of said cushion body (2); and connecting means (11, 14, 14a, 3a) being provided to connect said rods (3) to said first platelike portion (10).

20 2) A device as claimed in Claim 1, characterized in that said second platelike portion (15) is separate from said cushion body, and carries fastening means (19) for said cushion body (2).

25 3) A device as claimed in Claim 1, characterized in that said rods (3) are separate from said supporting frame (5), and in that said first platelike portion (10) carries, for each of said rods (3), a retaining seat (14) engageable by a connecting portion (3a) of the relative

rod (3); retaining means (14a) being associated with said retaining seat (14) to retain said connecting portion (3a) inside said retaining seat (14).

4) A device as claimed in Claim 3, characterized in 5 that said supporting frame (5) also comprises two shoulders (11) located on opposite lateral sides of said first platelike portion (10), and each defining a lateral support for said cushion body (2).

5) A device as claimed in Claim 4, characterized in 10 that each said shoulder (11) is defined by a plate connected to said first platelike portion (10).

6) A device as claimed in Claim 4, characterized in that said first platelike portion (10) and said shoulders (11) form part of a single monolithic, substantially U- 15 shaped body (13).

7) A device as claimed in Claim 4, characterized in that said shoulders (11) have respective holes (14) defining said retaining seats.

8) A device as claimed in Claim 2, characterized in 20 that said fastening means (19) for said cushion body (2) are fast-fit fastening means.

9) A device as claimed in Claim 8, characterized in that said fast-fit fastening means comprise bayonet connecting means.

25 10) A device as claimed in Claim 8, characterized in that said fast-fit fastening means comprise a projection (19) carried by said second platelike portion (15); a seat for housing said projection being carried by said

cushion body (2).
